90 day Churn Rate vs Revenue

Feb 1, 2019 - Sep 19, 2026

90 day Churn Rate by Traffic Source

Questions To Address

DEFINITIONS

Churn

An active customer is considered churned if they make no subsequent completed order within 90 days of their last completed order in that month.

Active Customer

A unique customer with at least one completed order during the month.

New Customer

Customer whose first-ever completed order occurs in that month.

Returning Customer

Customer with a completed order in a month after their first-purchase month

key metrics to monitor for a product change

Revenue, Average Order Value (AOV), order volume, gross profit, plus segment-level performance.

ALTERNATIVE DEFINITIONS

Active Customer

A customer is considered active if they made a purchase within the last 30, 60, or 90 days, instead of requiring a purchase in the current calendar month. This is useful when recent customer engagement matters more than monthly reporting.

New Customer

Define “new” as the first 30 days after first purchase. This gives every customer the same lifecycle window.

Returning Customer

Require a second completed order, regardless of calendar month, when measuring repeat-purchase behavior specifically.

Questions To Address

Most important trend for leadership

Revenue is growing, but repeat purchasing remains weak. Returning customers generated only 12.39% of total revenue, while the 90-day non-repeat/churn rate remained around 98% and was consistently high across traffic sources.

Impact

87.61% of revenue comes from customers classified as new, suggesting the business is heavily dependent on continued customer acquisition. Improving repeat purchasing could create an additional source of growth and reduce reliance on constantly acquiring new customers.

Questions To Address

Business initiative

Launch a second-purchase retention program for first-time customers. The idea would be to encourage a customer to make a second purchase within 90 days of their first order using post-purchase messaging, personalized recommendations, loyalty incentives, or a targeted offer.

Target

All traffic sources would be considered because the churn analysis showed that the 90-day non-repeat rate is consistently high across acquisition channels. This suggests the retention issue is broad rather than isolated to one source.

Success

- Primary KPI: 90-day repeat purchase rate*
- Secondary KPIs: returning revenue share, time to second purchase, AOV, and gross profit*

Thank you
